

Finding The Way Forward: Mining, Metal and Biodiversity Frameworks

Navigating the world of biodiversity frameworks

In the last few years, to meet the needs of increasing concern about biodiversity loss and the action needed to halt and reverse this loss, greater attention has been given to corporate environmental reporting and target-setting.

These aim to encourage the implementation and monitoring of sustainable approaches to business operations. As a result, a raft of different approaches have been developed, such as regulations, certification principles and voluntary frameworks.

Selecting the right approach and framework

But which framework is best for your business, and how do these different approaches overlap? Do they all require disclosure, and what are the implications of the increased disclosure of biodiversity data for my business? These are all questions we hear from organisations within the mining and metals industries.

How we can help?

The Biodiversity Consultancy has been involved in the development of a number of the standards and frameworks which are now in use, such as TNFD and ICMM's Nature Position Statement, and so has an in-depth understanding of the application of the frameworks and standards.

We can provide guidance to our corporate clients to enable them to navigate the complexities of these frameworks through an informed decision-making process.

Contact us

As part of our desire to provide guidance to our clients, we would be keen to know more about the questions or issues you are having with understanding and applying the standards and frameworks. Once we have further understood these issues, we will provide an online webinar to fill the knowledge gaps, to enable our clients to apply relevant frameworks and standards.

So do let us know your thoughts and questions, either in person at the breakfast on the 3rd October, or via email if you cannot attend.
